

AI FLUENCY · CAPSTONE MVP

Research Scout MVP

Checkpoint 1: the agent runs end-to-end. Live tool connections (web_search + page_reader + LLM). A raw, unedited run capture. An honest build log — what broke, what changed, what was cut.

Mahmoud ABD ELKream

Front-End Developer & Product Designer · Alexandria, Egypt

The Working Agent — Overview

The Research Scout MVP runs end-to-end: it gathers 15 job listings from 3 sources (LinkedIn Jobs, Upwork, Wuzzuf), reads the top 8 via `page_reader`, scores each on a 4-criteria rubric (/9), filters to those scoring 5+, and formats a clean digest. No mid-run hand-editing. The agent code is a single Python script (~220 lines) that orchestrates 3 live tool connections.

Live Tool	Type	What It Does in the Agent	Calls/R un
web_search	External service (z-ai SDK)	GATHER step: searches LinkedIn, Upwork, Wuzzuf for jobs matching Mahmoud's skills. Returns title + URL + snippet per result.	3
page_reader	External service (z-ai SDK)	READ step: fetches full job description text from each candidate URL. Returns parsed title + plain text.	8
LLM (chat)	AI model (z-ai SDK)	SCORE step: scores each job on skill/domain/seniority/location fit. FORMAT step: produces the final digest.	9

Table 1. Three live tool connections, 20 total tool calls per run. All via the `z-ai-web-dev-sdk` (free tier). No mock data, no hardcoded results.

Agent Code (Full Script)

The entire agent is one Python file: `agent_mvp/scout.py`. The code below is the complete script, unedited. It is also pushed to the GitHub repo.

```
#!/usr/bin/env python3 """ Research Scout – Capstone MVP Agent (enhanced)
===== A working personal AI agent that pre-qualifies
healthcare/e-commerce product roles and freelance gigs matching Mahmoud's profile. Built per the
FL-06 spec: - 5-step workflow: GATHER → READ → SCORE → FILTER → FORMAT - Live tool connections:
web_search + page_reader + LLM (z-ai SDK) - Guardrails: MUST NEVER auto-apply, MUST cite JD URLs,
MUST log audit trail Enhancements over the base MVP: - Daily history log (each run appended to
history.jsonl) - Email-ready digest output (digest_email.txt, paste into any email client) -
Environment-variable config (for cron / GitHub Actions) - Exit codes: 0 = success, 1 = no
candidates, 2 = tool failure """ import json import os import subprocess import sys import time from

```

SECTION 03

Build Log — Honest Iteration

The brief asks for real iteration, not a clean retroactive story. The log below is the actual sequence: what I tried, what broke, what I changed, what I cut.

#	What I Tried	What Happened	What I Changed
1	First run: web_search on broad queries like “React developer Egypt” without site: prefix.	Results were generic articles and tutorials, not job postings. 8 of 8 candidates were useless.	Added site: prefix to queries (site:linkedin.com/jobs, site:upwork.com, site:wuzzuf.net). Results became actual job postings.
2	READ step: page_reader on all 15 candidates (no dedup, no cap).	Took 120+ seconds. Several URLs returned Cloudflare verification pages (Upwork blocks scrapers). Wasted 4 page_reader calls on inaccessible pages.	Added dedup by URL + capped at 8 reads. Accepted that Upwork Cloudflare blocks are unavoidable for the MVP.
3	SCORE step: asked LLM to return JSON with scores.	LLM returned JSON wrapped in markdown code fences. json.loads() failed.	Added fence-stripping logic: detect “```” prefix, extract content between first “{” and last “}”. Robust to markdown wrapping.
4	FORMAT step: asked LLM to produce the digest with apply-by dates.	LLM invented apply-by dates that were not in the JDs. Guardrail violation.	Removed apply-by date from the format spec. If the JD doesn’t state a deadline, the digest omits it.
5	Spec said cron trigger at 9 AM EET.	No cron available in the sandbox environment.	Cut for MVP. Manual trigger only. Cron is a post-MVP enhancement.

#	What I Tried	What Happened	What I Changed
6	Spec said email output channel.	Would require SMTP or email API setup.	Cut for MVP. Output to terminal + audit log file only.
7	Acoer role scored 5/9 (above threshold) but has “too senior” + “visa concern” red flags.	Threshold filter didn’t catch it because skill + domain match carried the score above 5.	Fixed: added seniority penalty (-2 if “too senior” in red_flags). Later enhanced to multi-signal detection (4 signals, cap -4).

Table 2. Build log — 7 iterations. Items 5 and 6 were cut from the spec. Items 1–4 were bugs fixed during the build. Item 7 was a scoring bug fixed and later enhanced.

SECTION 04

Deviations from FL-06 Spec

The brief says deviating from the spec is normal; documenting it is the requirement. Three deviations, each with a reason.

Spec Item	Deviation	Reason
Cron trigger at 9 AM EET	Cut. Manual trigger only (python3 scout.py).	No cron available in sandbox. External scheduler is a post-MVP task.
Email output channel	Cut. Output to terminal + audit_log.json + run_capture.txt.	Email setup adds non-core config. Digest is already visible in terminal.
Apply-by date in digest	Cut. Digest shows score + rationale + URL only.	LLM was inventing dates not in the JDs. Guardrail violation.
Seniority auto-filter	Implemented + enhanced. Multi-signal penalty (4 signals, cap -4).	Original threshold didn’t catch senior roles. Fixed with penalty system, then enhanced with keyword + years + lead-title detection.

Table 3. Four deviations. Three cuts (cron, email, apply-by date) and one enhancement (seniority filter). All documented with reasons.

SECTION 05

Run Capture — Raw & Unedited

The full terminal output of one complete end-to-end run. Timestamped, unedited, showing every step from request to result. The run took ~92 seconds total: 9s gather + 69s read + 14s score + format.

SECTION 06

Audit Log — Guardrail Evidence

Guardrail from FL-06: “MUST log all fetched URLs to an audit file so human can review what was filtered out.” The audit log below is the raw JSON from the run.

Field	Value
Run timestamp	2026-08-19T13:12:26.916336
Queries run	3
Candidates fetched	15
Candidates read (page_reader)	8
Candidates qualified (score ≥ 5)	3
Threshold	5/9

Per-candidate audit entries (abridged):

```
[1] score: 5/9 | source: LinkedIn Jobs | flags: low-signal, unclear company domain title: Frontend Development Intern ( React Js ) at Icura url: https://www.linkedin.com/jobs/view/4400030043 [2] score: 0/9 | source: LinkedIn Jobs | flags: too senior, visa issue (on-site in The Dalles, OR) title: Acoer hiring Senior Front-End Developer in Egypt url: https://www.linkedin.com/jobs/view/senior-front-end-developer-at-acoer-428018405 [3] score: 4/9 | source: LinkedIn Jobs | flags: visa issue, low-signal title: Flatgigs hiring Mobile Developer- React in Egypt url: https://www.linkedin.com/jobs/view/4334134593 [4] score: 3/9 | source: LinkedIn Jobs | flags: too senior (6+ yrs req), visa issue (on-site in The Dalles, OR) title: Senior Frontend Engineer - React / React Native (Web & url: https://www.linkedin.com/jobs/view/4404592170 [5] score: 7/9 | source: LinkedIn Jobs | flags: none title: Frontend Developer at Halian url: https://www.linkedin.com/jobs/view/frontend-developer-at-halian-managed-services [6] score: 0/9 | source: Upwork | flags: low-signal, inaccessible-content title: Best Freelance UX Designers for Hire (Aug 2026) url: https://www.upwork.com/hire/ux-designers [7] score: 7/9 | source: Upwork | flags: low-signal title: UI/UX Designer Needed for E-commerce Product Page url: https://www.upwork.com/freelance-jobs/apply/Designer-Needed-for-commerce-Product [8] score: 0/9 | source: Upwork | flags: low-signal, inaccessible-content title: Best Freelance Mobile UI Designers for Hire (Aug 2026) url: https://www.upwork.com/hire/mobile-ui-designers
```

SECTION 07

How This Maps to the Rubric

The five pass/revise criteria, mapped one-to-one. **(1) Agent completes its core job end to end without mid-run hand-editing** — yes. The run capture in Section 5 shows the full loop: 15 candidates gathered, 8 read, 8 scored, 3 qualified, digest formatted. No human intervention. **(2) At least one live tool, file, or data connection in use** — yes, three live tools: web_search (3 calls), page_reader (8 calls), LLM (9 calls). All via z-ai-web-dev-sdk. See Table 1. **(3) Matches the FL-06 spec, or deviations documented with reasons** — yes. Section 4 (Table 3) documents 4 deviations: cron cut, email cut, apply-by date cut, seniority filter enhanced. Each has a reason. **(4) Build log shows real iteration, not a clean retroactive story** — yes. Section 3 (Table 2) logs 7 iterations. Each entry pairs “what I tried” with “what happened” and “what I changed.” **(5) Run capture unedited, showing the full loop from request to result** — yes. Section 5 contains the complete terminal output of the run. Nothing was edited.
