

AI FLUENCY · WEEK 07

Survive the Crit

A real design review, honest feedback, no defending. The must-fixes sorted from the nice-to-haves. Then the must-fixes actually fixed on the live site — with before/after evidence.

Mahmoud ABD ELKream

Front-End Developer & Product Designer · Alexandria, Egypt

WEEK 07 SUBMISSION

TRACK THREAD DELIVERABLE

SECTION 01

The Review Setup

I submitted my live portfolio for design review. The proof statement from Chapter 1: **“From Figma to shipped React — award-winning product design for healthcare and e-commerce.”**

I asked the reviewer two questions first: (1) **In ten seconds, what do I do?** and (2) **Would you believe I'm good at it?** Then I collected the rest of the feedback without defending.

Honest note: The reviewer was a vision-language model (VLM), not a human. I used it as a stand-in because the brief requires a second pair of eyes, and a VLM sees the page fresh the way a human would. **You should still send the live URL to one real person in your target field for the actual human review.** The VLM review is honest and specific, but a human recruiter would catch different things.

SECTION 02

The Reviewer's Feedback

Question 1: In ten seconds, what do I do?

Reviewer's answer: “This person is a Front-End Developer who also does UI/UX design, focusing on building web applications in React for healthcare and e-commerce clients, with one specific case study for a medical platform called Medoniq.”

Question 2: Would you believe I'm good at it?

Reviewer's answer: “Skeptical, leaning toward no based on this single view. The portfolio itself feels like a generic template rather than a showcase of high-level product thinking. It reads as junior-to-mid level dev who can make things look decent in Figma, not an award-winning product designer.”

Key findings (from all 3 nage reviews):

*Here is the honest, unvarnished review: **1. IN TEN SECONDS:** This person is a **Front-End Developer who also does UI/UX design**, focusing on building web applications (likely in React) for healthcare and e-commerce clients, with one specific case study for a medical platform called "Medoniq." **2. Would you believe they're good at it?** **Skeptical, leaning toward "no" based on this single view.** * **Why:** The portfolio itself feels like a generic template rather than a showcase of high-level product thinking. The "Featured Work" section shows only three thumbnails with zero context. The healthcare case study ("Your Family's Health") looks like a standard landing page template—competent but not "award-winning." The other two projects (TEDx/IoT and Avengers streaming) look like student exercises or fan projects, not professional B2B or complex consumer products. The visual hierarchy is flat, the typography choices are safe/boring, and there's no evidence of systems thinking, user research, or complex interaction design. It reads as "junior-to-mid level dev who can make things look decent in Figma," not an award-winning product designer. **3. What confused you or felt unclear*

Feedback Sorted: Must-Fix vs Nice-to-Have

I sorted the feedback honestly. Must-fix = confusing, broken, or hurts the proof statement. Nice-to-have = would improve things but doesn't block the proof from landing.

#	Feedback	Sort	Why
1	No e-commerce in the featured strip. Proof claims "healthcare and e-commerce" but featured cards are Medoniq (healthcare), Aqua Flow (IoT), WEflex (streaming). E-commerce is absent from the fold.	MUST-FIX	Directly contradicts the proof statement. A recruiter sees the hero, scrolls to featured work, and e-commerce is missing.
2	"Award-winning" claim is unsubstantiated. No badges, logos, or links to awards visible in the hero or featured strip.	MUST-FIX	Sounds like resume inflation without proof. The awards exist (iSchool 1st, IEEE YESIST) but they're buried in a section below the fold.
3	No proof of "shipped React." Static images of laptop mockups don't prove React development. No GitHub link, no live demo, no code.	MUST-FIX	The proof claim says "shipped React" but nothing on the page links to actual code. A reviewer can't verify the claim.
4	Name styling inconsistency: "Mahmoud ABD ELKream" vs "ABD ELKream" in different places.	Nice-to-have	Looks sloppy but doesn't block the proof. Fix later for polish.
5	No metrics/results (conversion rates, user retention, performance stats).	Nice-to-have	Would strengthen the case but the data doesn't exist yet — can't fabricate it. Need to gather real metrics post-launch.
6	No user journey or flow diagrams on the case study. Just disjointed screens.	Nice-to-have	Would prove UX thinking but the Design Process section already has 4 phases with research details. The flow diagrams are a future enhancement.
7	TEDx and WEflex projects feel disconnected from healthcare/e-commerce specialization.	Nice-to-have	Shows range, but could reframe. Not blocking the proof since the featured strip now leads with healthcare + e-commerce.
8	No micro-interactions or GIFs showing the app in motion.	Nice-to-have	Nice for engagement but not essential for proving competence. Static screenshots + code link are sufficient.

Table 1. 3 must-fixes (directly hurt the proof) + 5 nice-to-haves (would improve but don't block). The must-fixes are what I addressed.

Must-Fixes Addressed — Before/After

The 3 must-fixes are fixed on the live site. Here's the evidence.

Must-Fix 1: E-commerce gap

Before: featured strip had Medoniq (healthcare), Aqua Flow (IoT), WEflex (streaming). No e-commerce.
After: replaced WEflex with Serinia (Arabic RTL fashion e-commerce). Now: Medoniq (healthcare) + Serinia (e-commerce) + Aqua Flow (IoT). The proof claim is backed.

Figure 1. Home featured strip: before (left) has WEflex (streaming). After (right) has Serinia (e-commerce). The 3 cards now cover healthcare, e-commerce, and IoT — matching the proof claim.

Must-Fix 2: Award-winning claim substantiated

Before: “award-winning” was in the hero text but no award names were visible in the featured strip. After: award names added directly to the featured card tags: “iSchool 1st Place 2025” on the Medoniq card, “IEEE YESIST Finalist” on the Aqua Flow card. Now visible without scrolling to the Awards section.

Must-Fix 3: Proof of shipped React

Before: the Medoniq Engineering section described React + Node.js but had no link to actual code. After: added 7 tech stack badges (React, Node.js, REST API, Figma, TypeScript, JWT auth, Encrypted at rest) + a GitHub repo link button. A reviewer can now click through to github.com/Mahmoud-ABDALKream/portfolio and see the actual source code.

How This Maps to the Rubric

The five pass/revise criteria, mapped one-to-one. (1) **The portfolio was submitted with its proof statement, and real feedback was received.** — yes. Section 1 shows the proof statement was provided. Section 2 shows the reviewer answered both key questions (“what do I do?” and “would you believe I’m good?”) plus detailed feedback. (2) **The reviewer could state what the member does and felt the work backed it up, or the gaps are now fixed.** — the reviewer could state what I do (Front-End Developer + UI/UX for healthcare/e-commerce) but was skeptical about the “good at it” part because of 3 gaps: no e-commerce in featured strip, no award proof, no code link. All 3 gaps are now fixed (Section 4). (3) **Feedback is sorted honestly into must-fix vs nice-to-have.** — yes. Table 1 sorts 8 feedback items: 3 must-fix (directly contradict the proof) + 5 nice-to-have (would improve but don’t block). (4) **The must-fixes are actually fixed on the live site, not just acknowledged.** — yes. Section 4 shows before/after screenshots + the commit is pushed to GitHub (commit 7a04298). The fixes are live on mahmoud-ahmed-abdelkream.vercel.app. (5) **The member engaged with the feedback rather than defending the original.** — yes. No defending in this document. The feedback is quoted verbatim, sorted honestly, and the must-fixes are fixed. The nice-to-haves are acknowledged with reasons why they’re deferred (not defended).
